Build the Full Picture of Transit Operations with Vontas

A proven solution, built around how transit actually runs

Transit operations are built from connected pieces. Dispatchers make real-time decisions. Operators need timely information. Vehicles communicate with the control center. Supervisors respond in the field. Service changes need to reach the right people and systems.

These aren't independent activities.

They're part of the same operating day. That's why Vontas is built for the whole operation, connecting the technology, people, vehicles, and data behind daily service. Because seeing what is happening isn't the same as running the operation.

The Full Picture Requires Deeper Data

A system can only act on the data it can reach. Public feeds carry what riders need to know, but an operation runs on much more: vehicle health, operator assignments, garage movements, pull-outs and pull-ins, non-public service patterns, and radio communications.

Vontas reaches deeper by connecting to the systems and vehicles doing the work, creating a foundation agencies can build on with applications, analytics, AI, cloud technology, and more.

Turning Incident Data Into One Clear Story

Vontas OnRecord helps investigators pull scattered evidence into a single defensible record, and spot costly trends - so they spend time deciding, not hunting. It brings together CAD/AVL data, incident reports, radio communications, and video by matching time, location, vehicle, context, and named entities.

OnRecord can turn hours of manual investigation into minutes, transcribe and summarize communications, surface patterns through analytics and natural language queries, and tie insights directly to their sources for transparent, defensible results.

Connecting Riders to the Operation

Virtual Stop Request, an innovative capability from Vontas and Transit App, connects rider technology directly with operations. When a rider approaching a stop shares their location through Transit App, Vontas OnRoute identifies the next bus serving that stop and sends a stop request directly to the vehicle. The operator receives an in-cab alert, helping reduce pass-ups and improve the rider experience.

Built With Transit, Not Just for Transit

At Vontas, presence isn't only staffing. It's

a practice. Through structured discovery, customer advisory meetings, user testing, site visits, and ride-alongs, product teams spend time in the operation with the people using our technology.

What's Running, Not What's Promised

Mission-critical systems should be judged on what's in service today, at what scale, and in operations that look like yours.

Vontas combines a proven operational foundation with modular applications, deeper integrations, AI, analytics, and cloud technology.

Choose the pieces your operation needs. Build the full picture with Vontas.
